

Experimental water-fill runs vs calibrated simulation

$T_{\text{plate}} = -10.0\text{ C}$, $T_{\text{amb}} = 9.71\text{ C}$, $T_{\text{fill}} = 12.5\text{ C}$, $h = 2.0\text{ W/m}^2\text{K}$, inset = 1 mm

Thin gray traces = individual runs; colored line/band = experimental mean ± 1 sigma; dashed black = simulation
